Not illustrated. 1920 Excerpt: ...first consider Thunder Crater, now known as Thunder Glacier. It lies on the opposite side of the main peak from Mazama Crater. At one time fluid lava boiled in this cauldron and ran out over the west rim like water, in very thin sheets. This all happened long after Summit Crater had slackened in its eruptions. But finally even Thunder Crater froze up. There was another lapse of inactivity; then there happened a spectacle of the ages. The bottom of the pit, about two miles across, had hardened to great depth, and when there was another eruption, it pushed the core of the pit upward as a monstrous plug about a thousand feet, then another thousand feet, and still another thousand feet, leaving it standing on the side of the mountain as the Black Buttes (Colfax, Lincoln and Seward peaks), three thousand feet above the crater bed, which it bottled up securely. The Black Buttes are among the most wonderful sights on the face of the globe; a solid, homogeneous mass of black basalt, dense, firm and somewhat vitreous, minaretted at the summit from blistering and cleaving in the extremes of heat and cold, oval in diameter, with a cross section of about two square miles, and rivaling the main summit of Mt. Baker in stupendous grandeur. Arranged in a row, twelve thousand of them would stretch around the globe, making a sort of Chinese wall over half a mile in height and three-quarters of a mile thick. On the opposite side, towards Mt. Shuksan, is Table Mountain, one corner of which is Mazama Dome, at Camp Sholes. This is another volcanic plug, forced up bodily, cutting Sholes Crater (Sholes Glacier) into Sholes and Bagley craters, and probably closing the era of

volcanic activity in this region also. The erosion from this plug is not extensive but progressive. A novel ...
