

The Human Quantum Leap: Confessions Of A Former Intelligence Operative

From Behind The Black Book of the American Intelligence Community comes this Non-Fiction. This is not about

wondering if we are alone in this universe. We are not alone and this book is about why. Unlike any other book ever written on this subject here you will read the science without the fiction. Here Researchers will understand why a space fairing race(s) visit yet make no contact, and the very first true glimpse of a much wider universe than anyone could possible ever have imagined. Space travel is NOT what our scientists believe it is. This book explains it all. From Inside The Book:

...When I asked Josh what he thought the body was he would only answer that, it wasnt human. When I asked the most obvious question; was it an alien? Josh was silent for a moment, then nodding his head yes... ...This is a book about the reasons why things happen the way they do and how Josh and I got involved; why we are being visited, and what they are looking for or want from us... ...The craft moved out of its hanger. It floats right past Josh as one of the tall strange looking ones came up alongside him. Josh was too stunned to notice. That was until this man began to speak. I imagine sergeant you find this overwhelming, he asked... Its not really black, John began to explain. It was just that Johns blood had ten times as many red blood cells as do normal humans. The density of these cells made it look black but it really is not... ...The book of John is my best analysis of answers to questions and conversations that primarily happened over a period of about five years just before Joshs death. We did have many serious conversations going back into the 1980s but nothing like the last five years. Once he knew he was dying I think Josh gave up caring about what he shared with me...

...A planets magnetosphere transmits information into the gravity well that its mass generates. This information is also

transmitted into open space. No two magnetospheres are exactly alike. However, they do change in ways that suggest a planets mass and even the chemical make-up of the planet across incredible distances...
